Pre-GreenCheck AI

Alex Hetherington

Euan Chan XuanXi

Freddie de Bruyn

Journey from previous project to now

Previous Project: GreenCheck AI

- **GreenCheck AI** is a project that utilize Explainable AI (XAI) for sustainability fraud (greenwashing) detection, providing clear, plain-language explanations for every flagged sustainability claim, in English, German and Spanish.
- **Client:** Legal Pythia - legal tech startup aims to help legal, finance and government bodies to manage large volumes of documents and data more efficiently using XAI for identifying fraud, detecting greenwashing and managing administrative/legal workflows.
- Meeting with client (CEO of Legal Pythia):
 - Having international users, language will be handled on their side
 - Wants us to build on their existing codebase, open to any extensions we want to do
 - Is non-technical, need to contact CTO for explanation for existing code

Previous Project: Finding out issues

- Meeting with CTO:
 - Backend = prompt engineering, wrapper around Gemini
 - Fully ai generated frontend and over 50% backend code
 - CTO not being able to explain the existing codebase - saying that it is self-explanatory
- Example of code (prompt) CTO presented to us in their current code:

```
You are an expert ESG analyst providing transparent, explainable assessments with source attribution.
```

```
IMPORTANT: You MUST respond ENTIRELY in ENGLISH. All explanations, quotes, summaries and recommendations must be in English.
```

```
CRITICAL: For EVERY score you assign, you MUST provide:
```

1. The exact reasoning why you chose that specific number
2. Which specific information from the sources influenced the score
3. What information was missing that prevented a higher score
4. Direct quotes from sources when available (translated to English if necessary)

Previous Project: Finding out issues

- Use of previous years' project as their demo of successful projects

Bermuda Monetary Authority Tackles Greenwashing with AI

The Bermuda Monetary Authority (BMA) turned to Legal-Pythia's ai fraud detection solution to combat greenwashing in sustainability reports. Our ai greenwashing detection solution uses **real-time web scraping** to detect discrepancies and ensure transparency.

Key Results

- 80% Faster Validation of 150+ reports monthly
- \$500,000 Saved Annually in operational costs
- 90% Improvement in detecting false claims

Legal-Pythia's solution empowers the BMA to efficiently verify

Previous Project: Resolving issues

- With the help and Advice from Sarah:
 - We cannot build things based on their existing codebase
 - Left with 3 Options for us
 1. Continue with the same client but start from scratch to build the product
 2. Select another project and transfer together as a team of 3 or 4
 3. Split and select different projects that suits our interest
 - Originally 4 people turned into 3 people – one member of the previous group split due to interest of projects not overlapping
 - Finally decided to go for Secondhand Marketplace

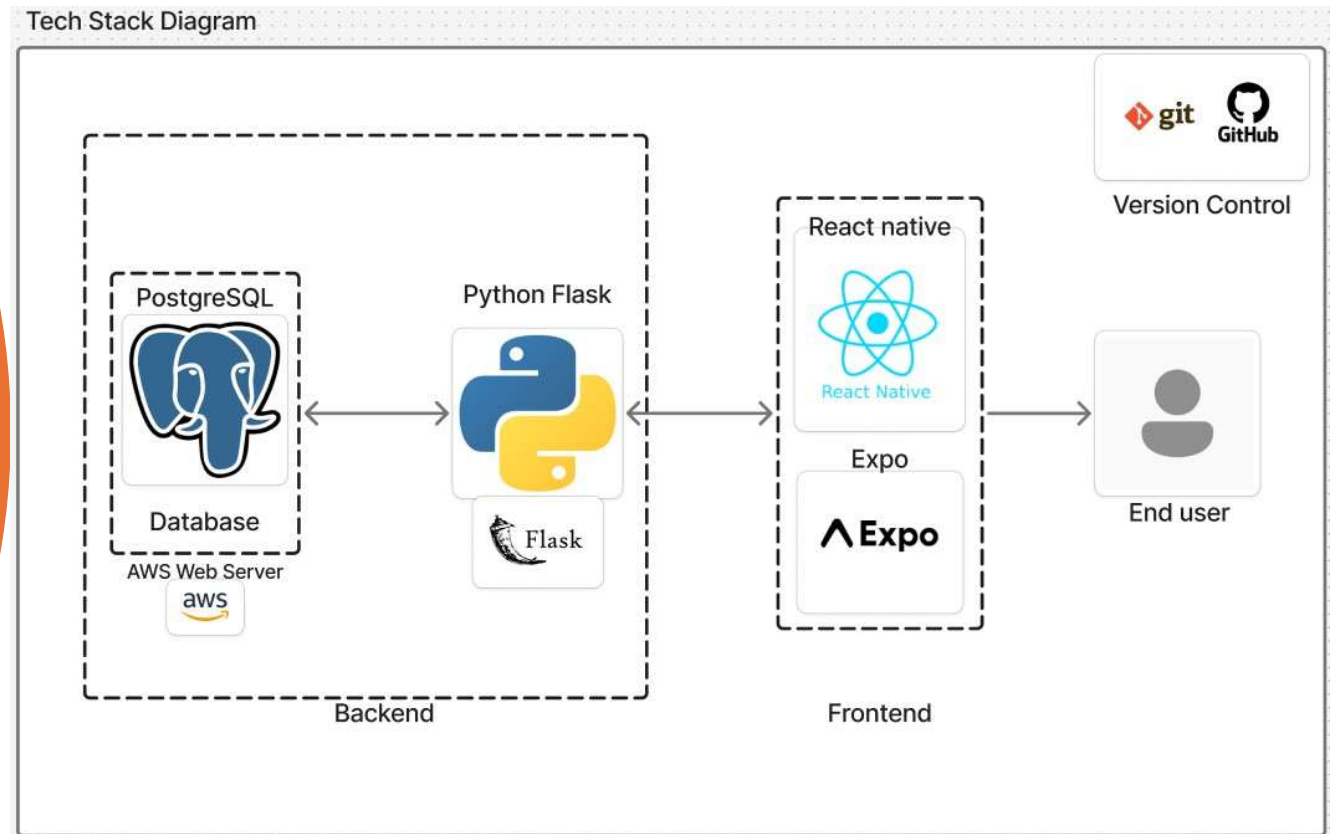

Current Project Scope and Context

- **Unique** online secondhand market platform that emphasizes on **fun interaction and credibility**
- **Client:** Marius, an individual who has a strong passion for this project

User stories

- As a **Buyer**, I want an engaging and interactive marketplace to easily find the items I'm looking for, and to explore reviews and ratings of sellers. I would also like to browse or be recommended items that would interest me, with the option to filter.
- As a **Seller**, I want a user-friendly marketplace to conveniently list the items I want to sell, and for them to reach the right audience of potential buyers.
- As a **Highly rated Seller**, I want a reliable system allowing buyers to trust me and enabling me to have an impactful and leading role in the community, potentially building a brand/identity.

Tech Stack Diagram

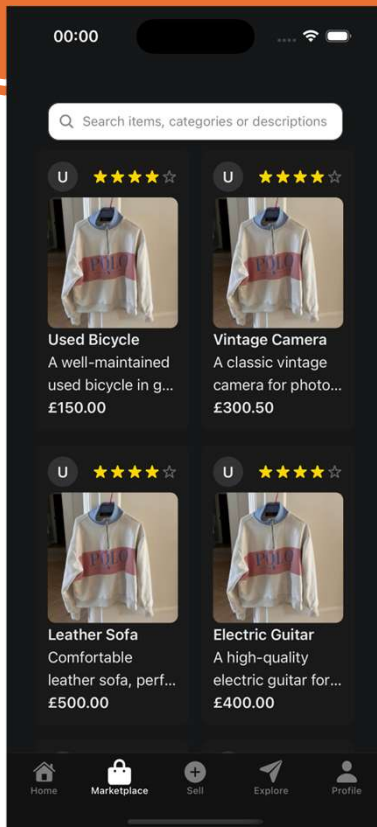

Main ideas of the product :

Case studies :

- Revolut – Smooth and simple UI
 - Duolingo – Gamification of interactions
 - Airbnb – review system
 - YouTube – Recommendation engine
-

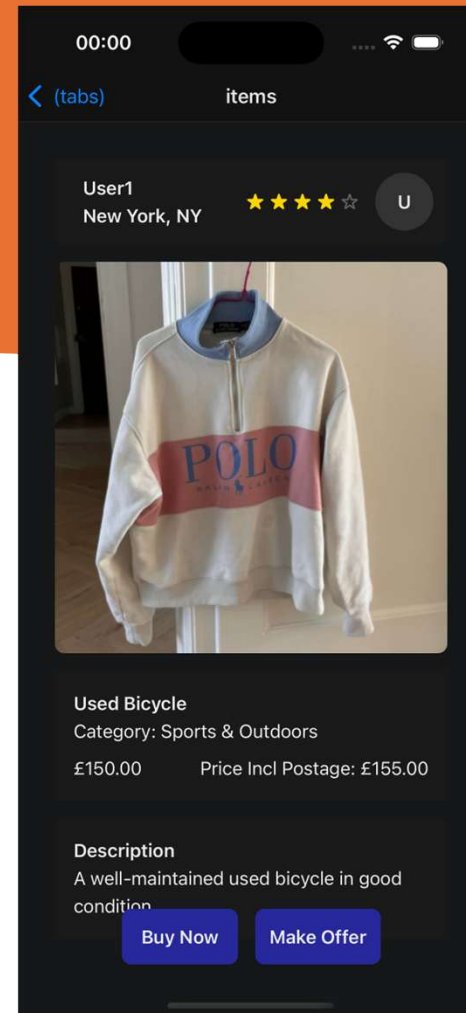

Frontend Demo

Marketplace Tab

Features:

- Search Bar
- Seller's profile and rating
- Image
- Listing name
- Abbreviated listing description
- Price
- Haptics for listings and search bar

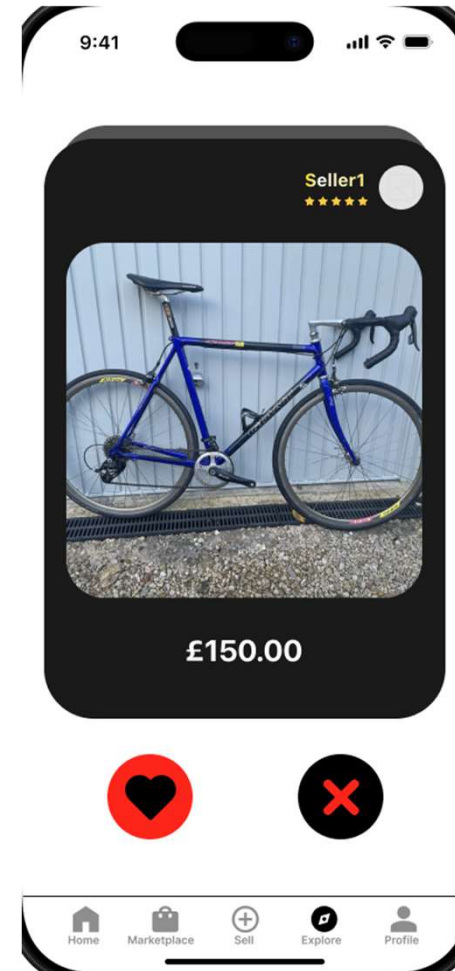

Item Listing

Features:

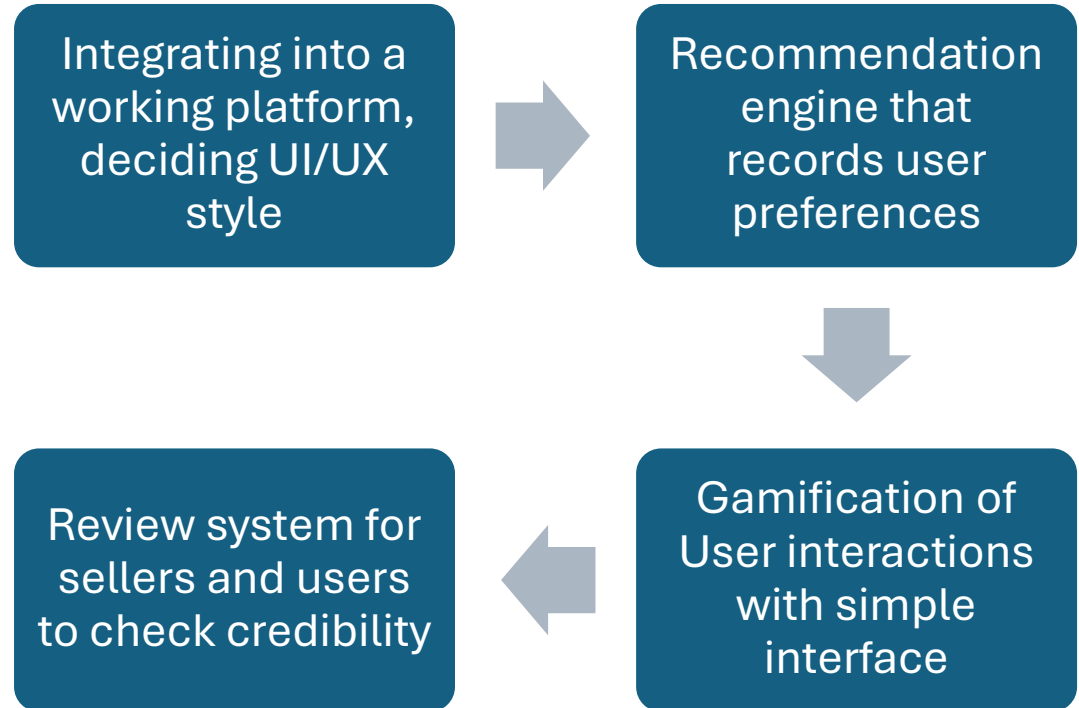

- Seller's Profile including approximate location
- Listing image
- Listing name
- Full description
- Price including price with postage
- Buy and Sell buttons
- Haptics for buy and sell buttons

Prototype Idea: Swipe and Explore

- **Key Ideas:**
- Keep the interaction with the user as simple as possible.
- User is given a personalised feed of listings.
- Only essential information about the listing shown (price & image).
- When the user likes a listing, it will be added to their liked items which they can then review later.

Product Future Roadmap

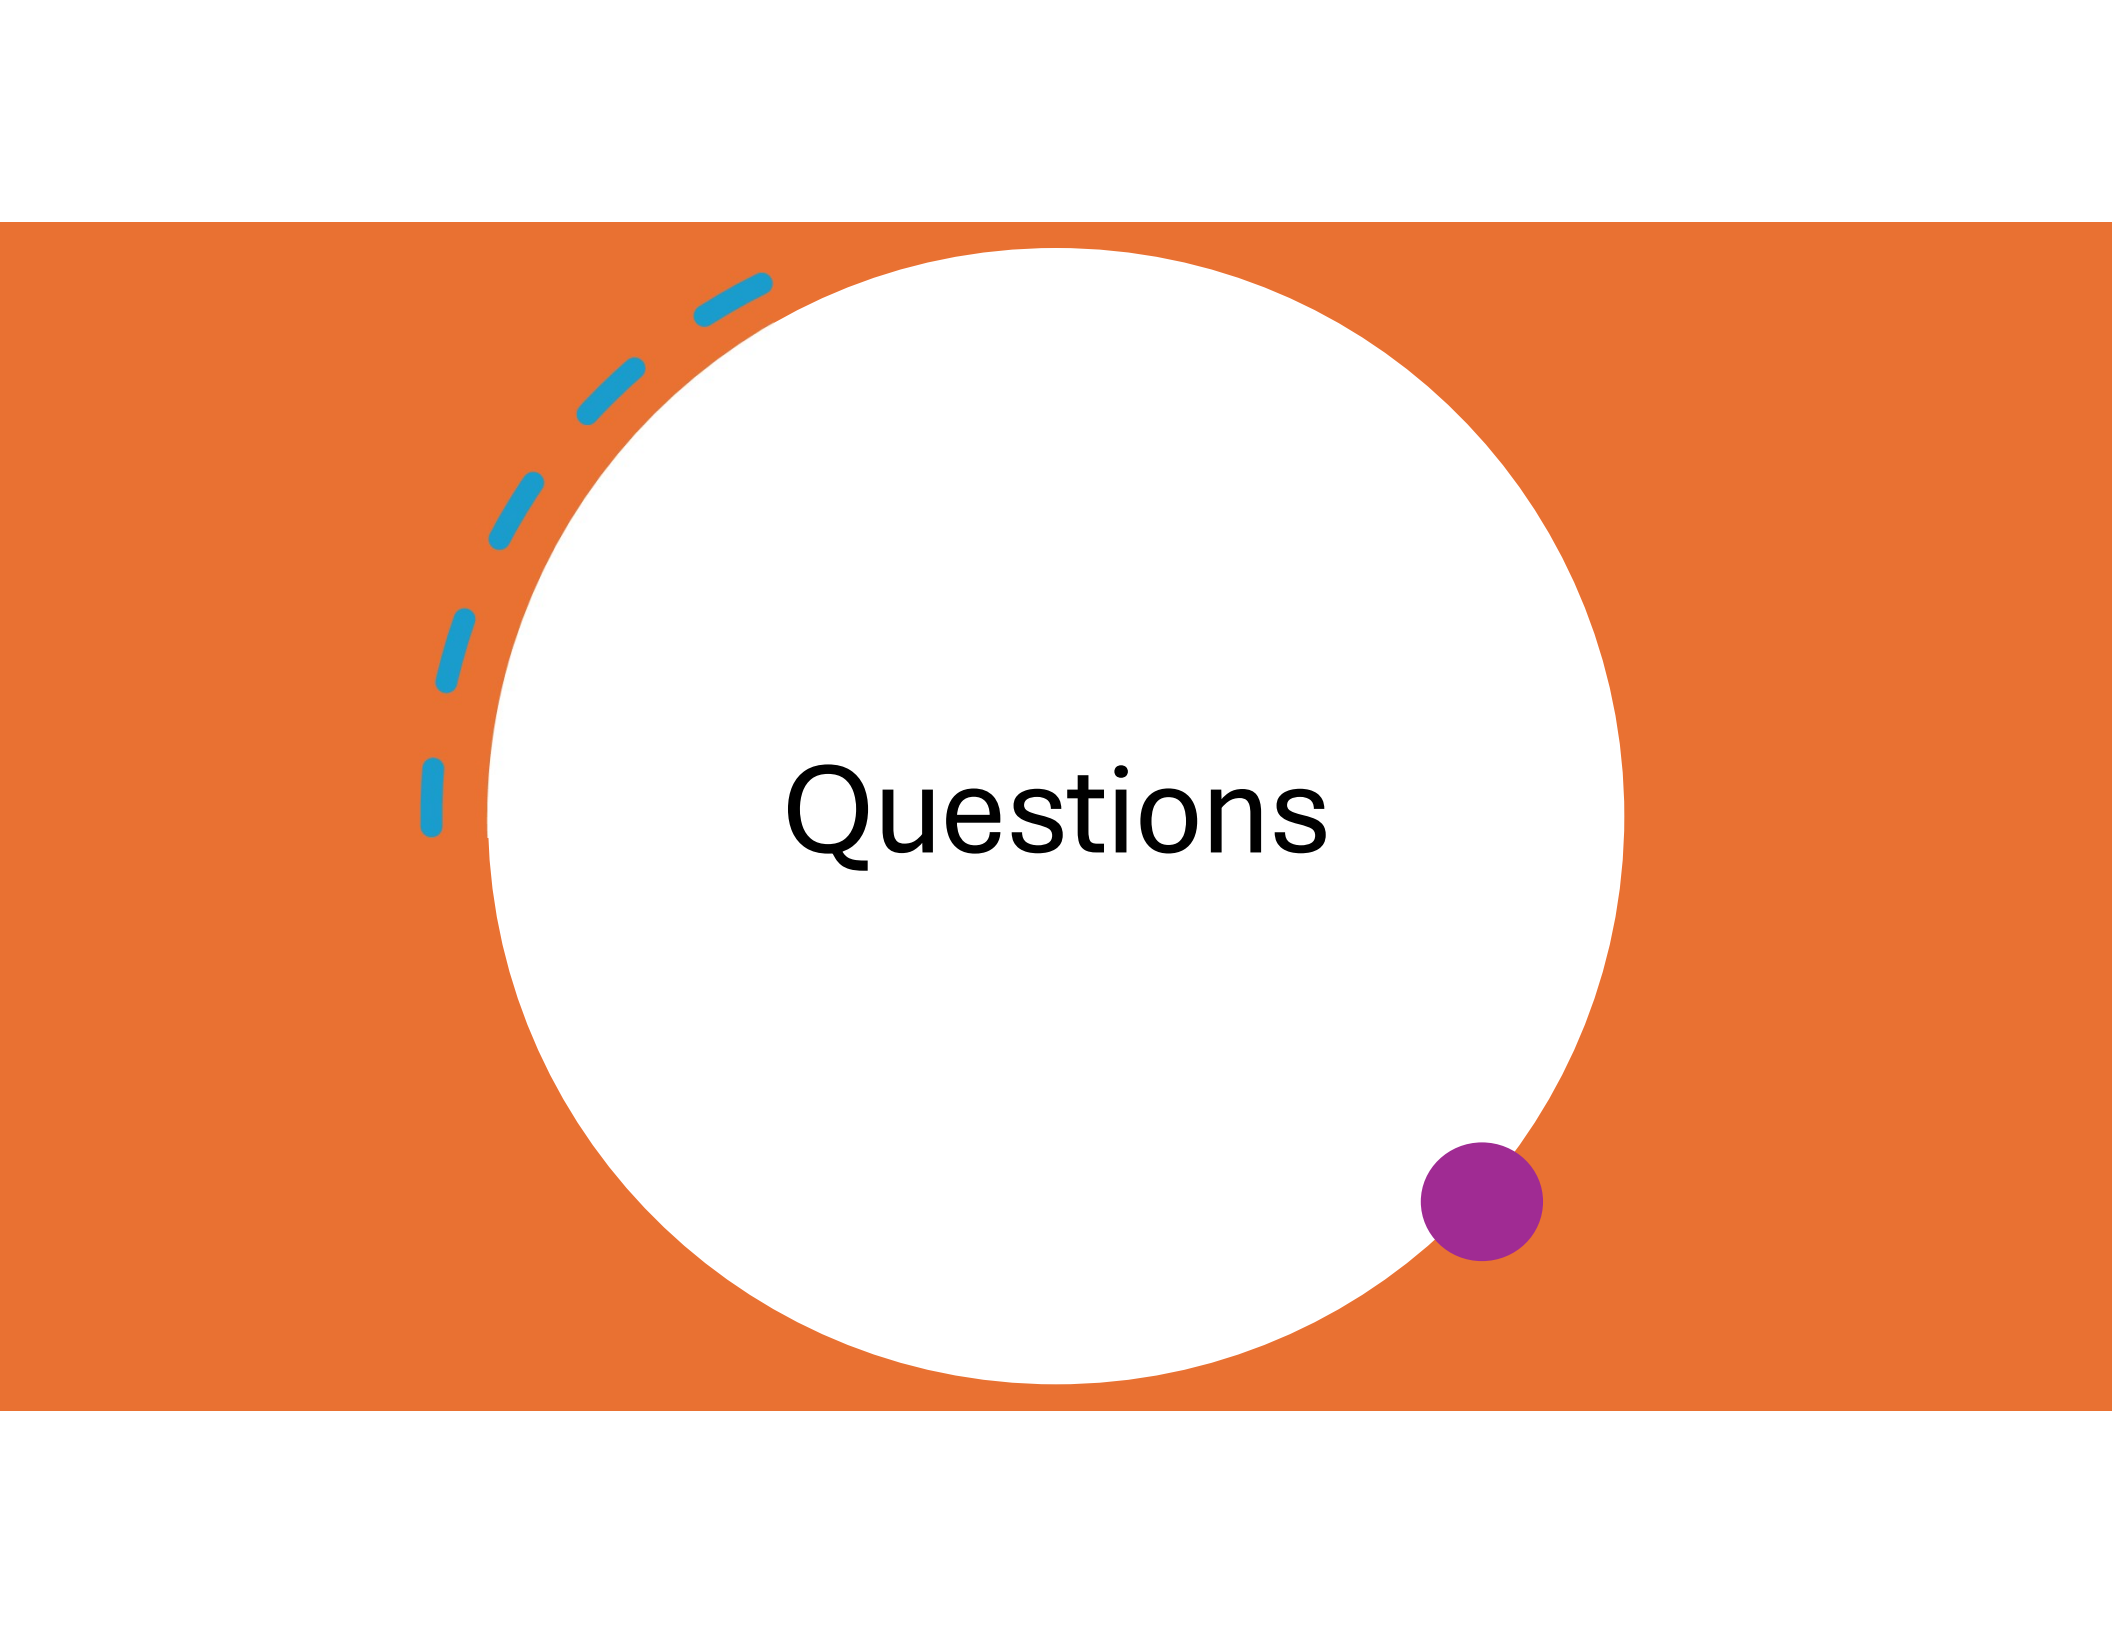

Process

- We meet every week in person to discuss about what needs to be done and allocate workload to everyone. We take guidance from our mentor for how to do this most effectively, ensuring each member has neither too much nor too little work.
- The current project manager is Alex, regularly checking on everyone's progress and decide what should be prioritized for this period.
- Communication: We constantly check with client with our updated progress and ask for feedback. We also inform each other within the team to ensure workloads / meetings can be adjusted to achieve goal in a reasonable way.

Future Project Management

- Rotating Project managers and rotating frontend/backend roles
- Define concrete end goals from the start and break it down into smaller goals for each stage
- Using more tests and CI/CD
